

# ***H2020 DiscardLess (2015-2019)***

## **What can science do to help with the landing obligation?**

**Pr. Clara Ulrich**, DTU Aqua, Denmark, coordinator  
on behalf of the **DiscardLess Consortium**

[www.discardless.eu](http://www.discardless.eu)

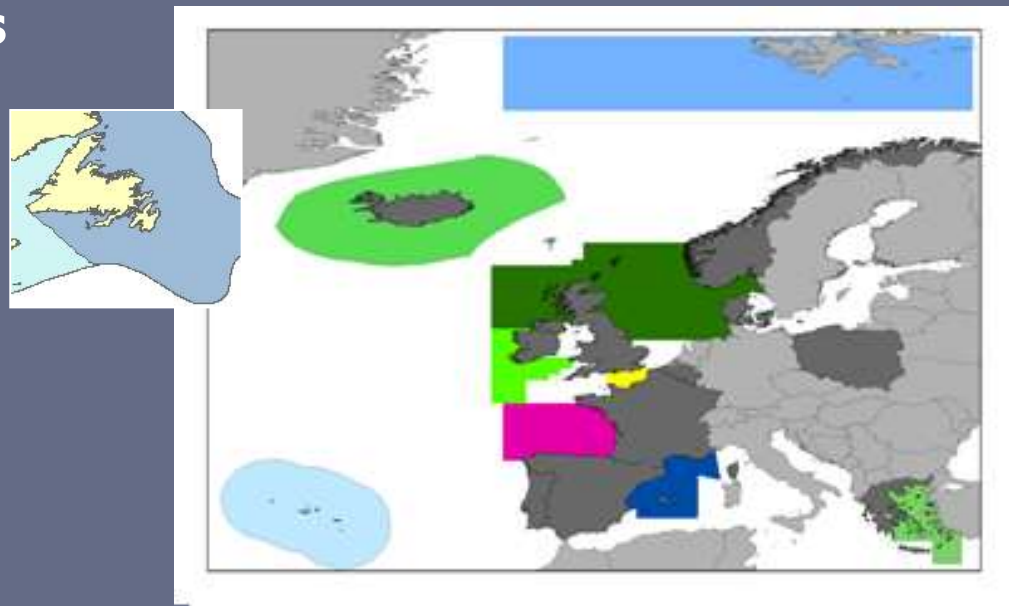

**DTU Aqua**  
National Institute of Aquatic Resources

$$M2_1 = \frac{\sum_j \frac{dR}{dt} N_j \frac{\varphi_{ji}}{\varphi_j}}{N_i \omega_i} \int_a^b \epsilon \Theta^\infty + \Omega \int \delta e^{i\pi} = \{2.7182818284\} \chi^2 \sum \gg \approx$$

# Consortium overview

- **31 partners in 12 countries**

- 9 universities
- 9 SMEs
- 8 research institutes
- 3 industries
- 2 organisations

# Project thread

**The 2013 EU Landing Obligation: An ambitious policy, that may impact the fishing industry in the short-term...**

- *Q: What can Science do to help mitigate such impacts, and so support the successful implementation of the policy?*
- **A: Science cannot force changes, but Science GATHERS and SHARES USEFUL KNOWLEDGE to inform changes!**

***DiscardLess: Multidisciplinary Science that aims to***

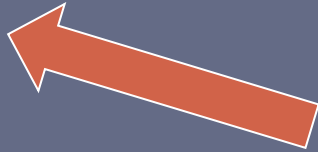

- ***UNDERSTAND*** the economic, biological and social drivers and impacts of discard
- ***PROPOSE*** a set of cost-effective Discard Mitigation Strategies: the DMS ToolBox

# What can Science do to help with the LO?

- What can Science NOT do alone? **FORCE CHANGES**

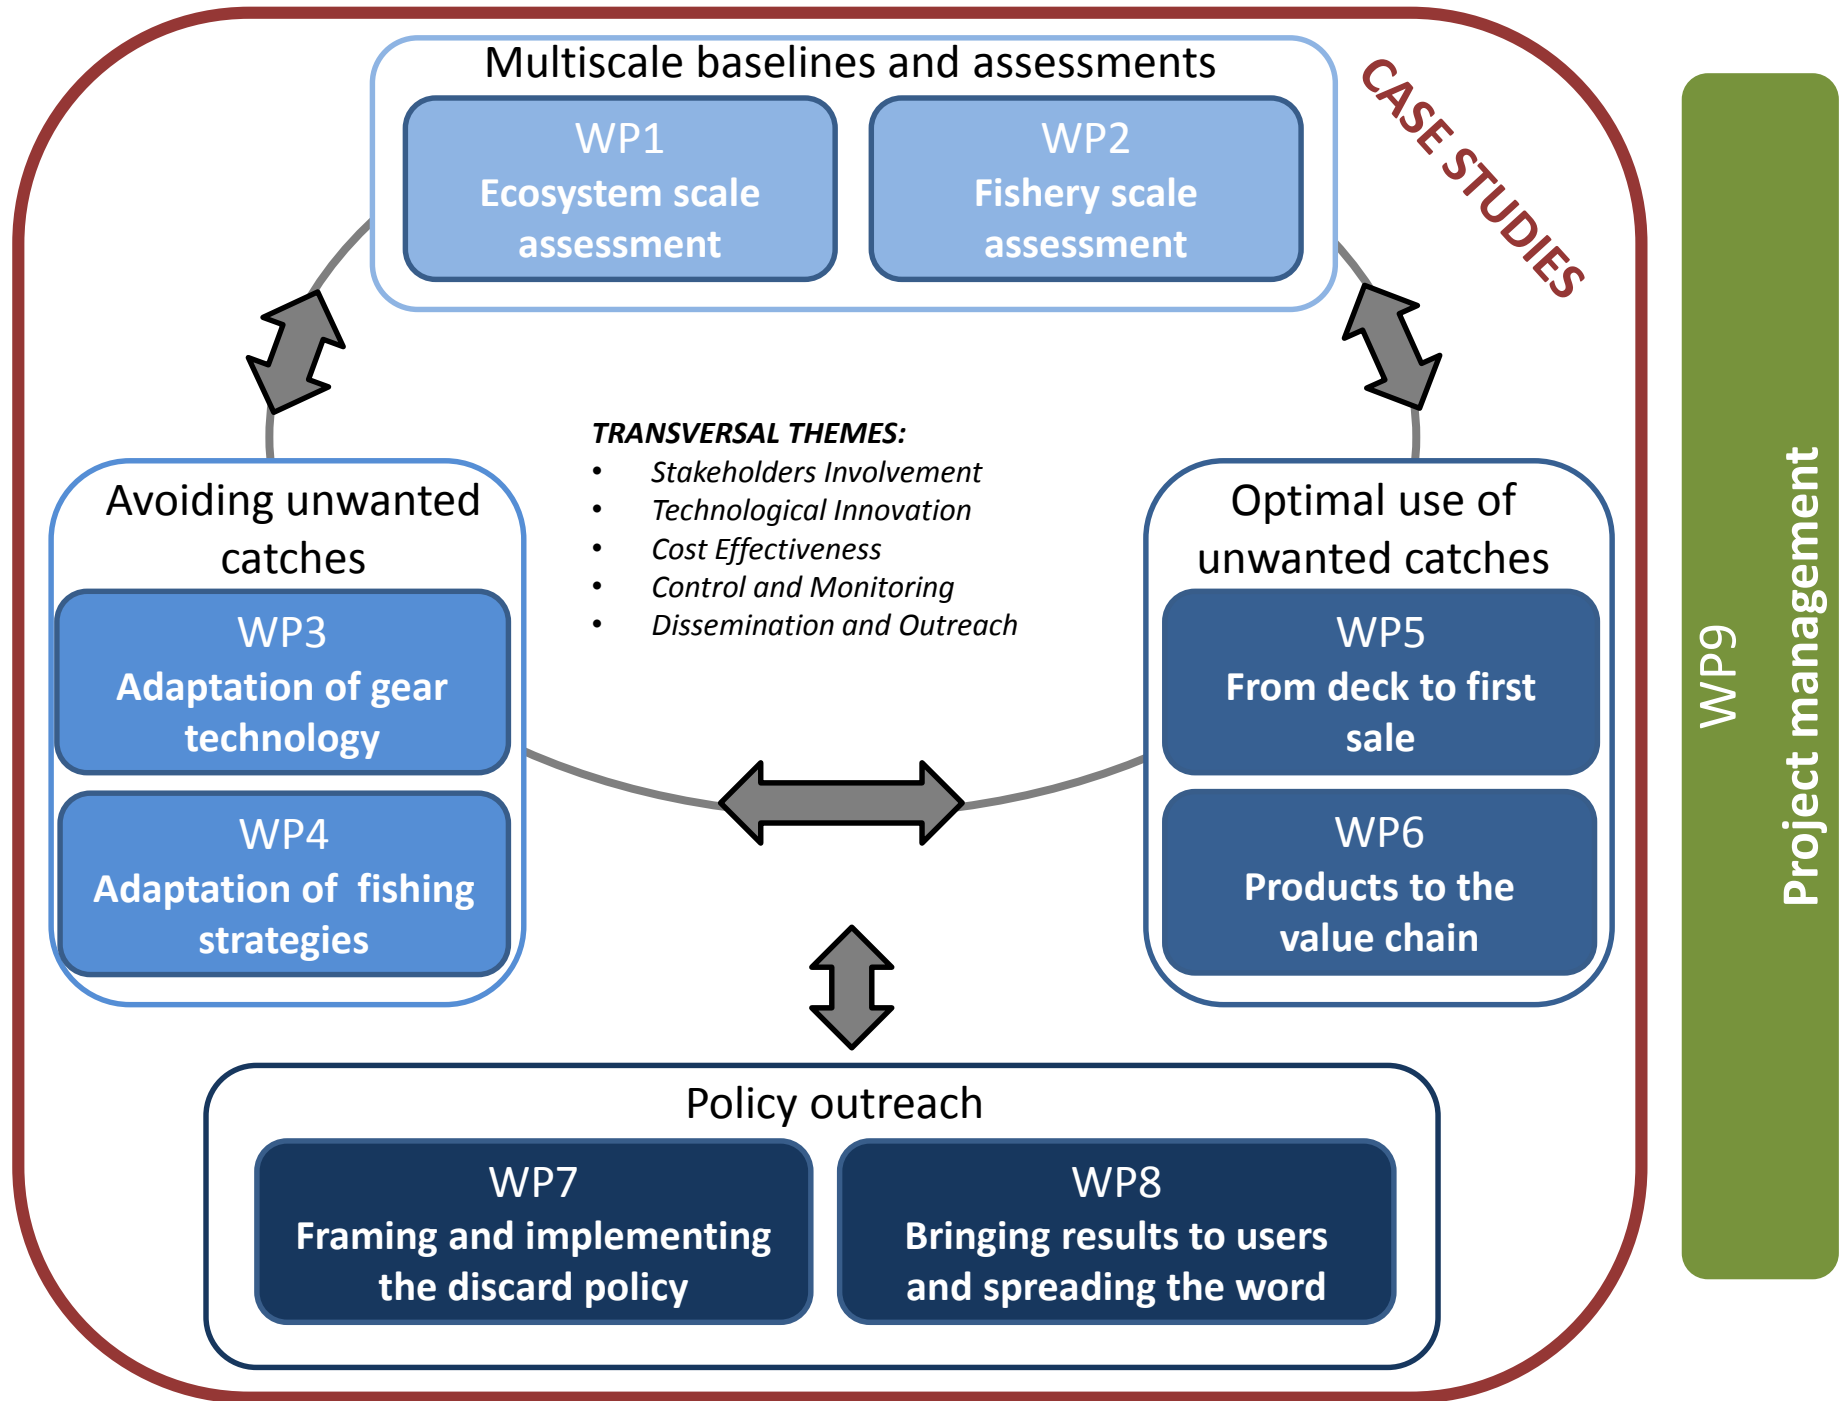

- Force the productivity of Nature
- Force uptake of selective devices and compliance
- Force rational policy
- Force the market

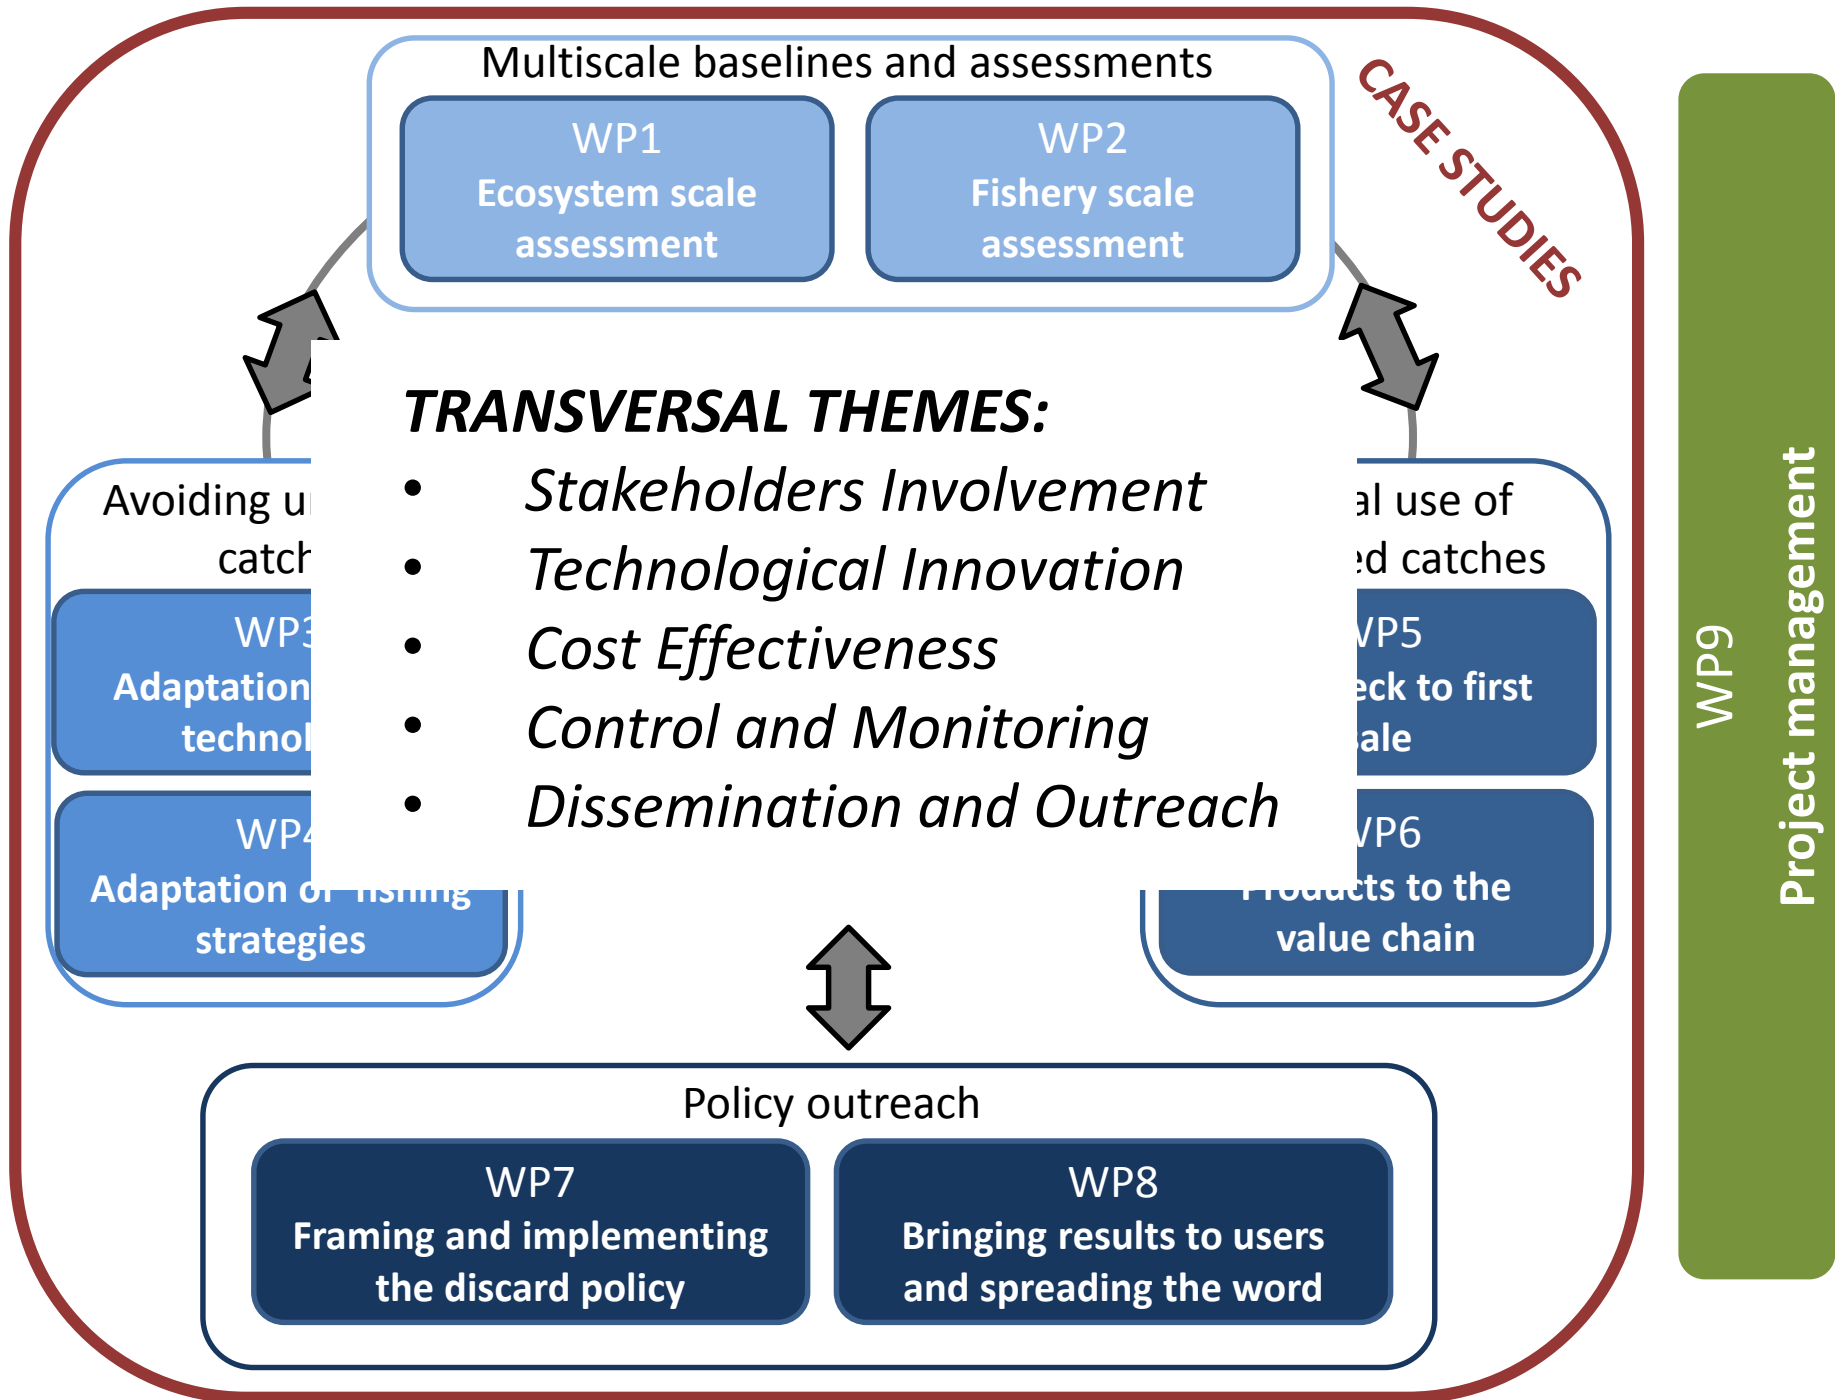

This we do together :  
stakeholders, policymakers,  
consumers, scientists

- What can Science do? **GATHER AND SHARE USEFUL KNOWLEDGE**

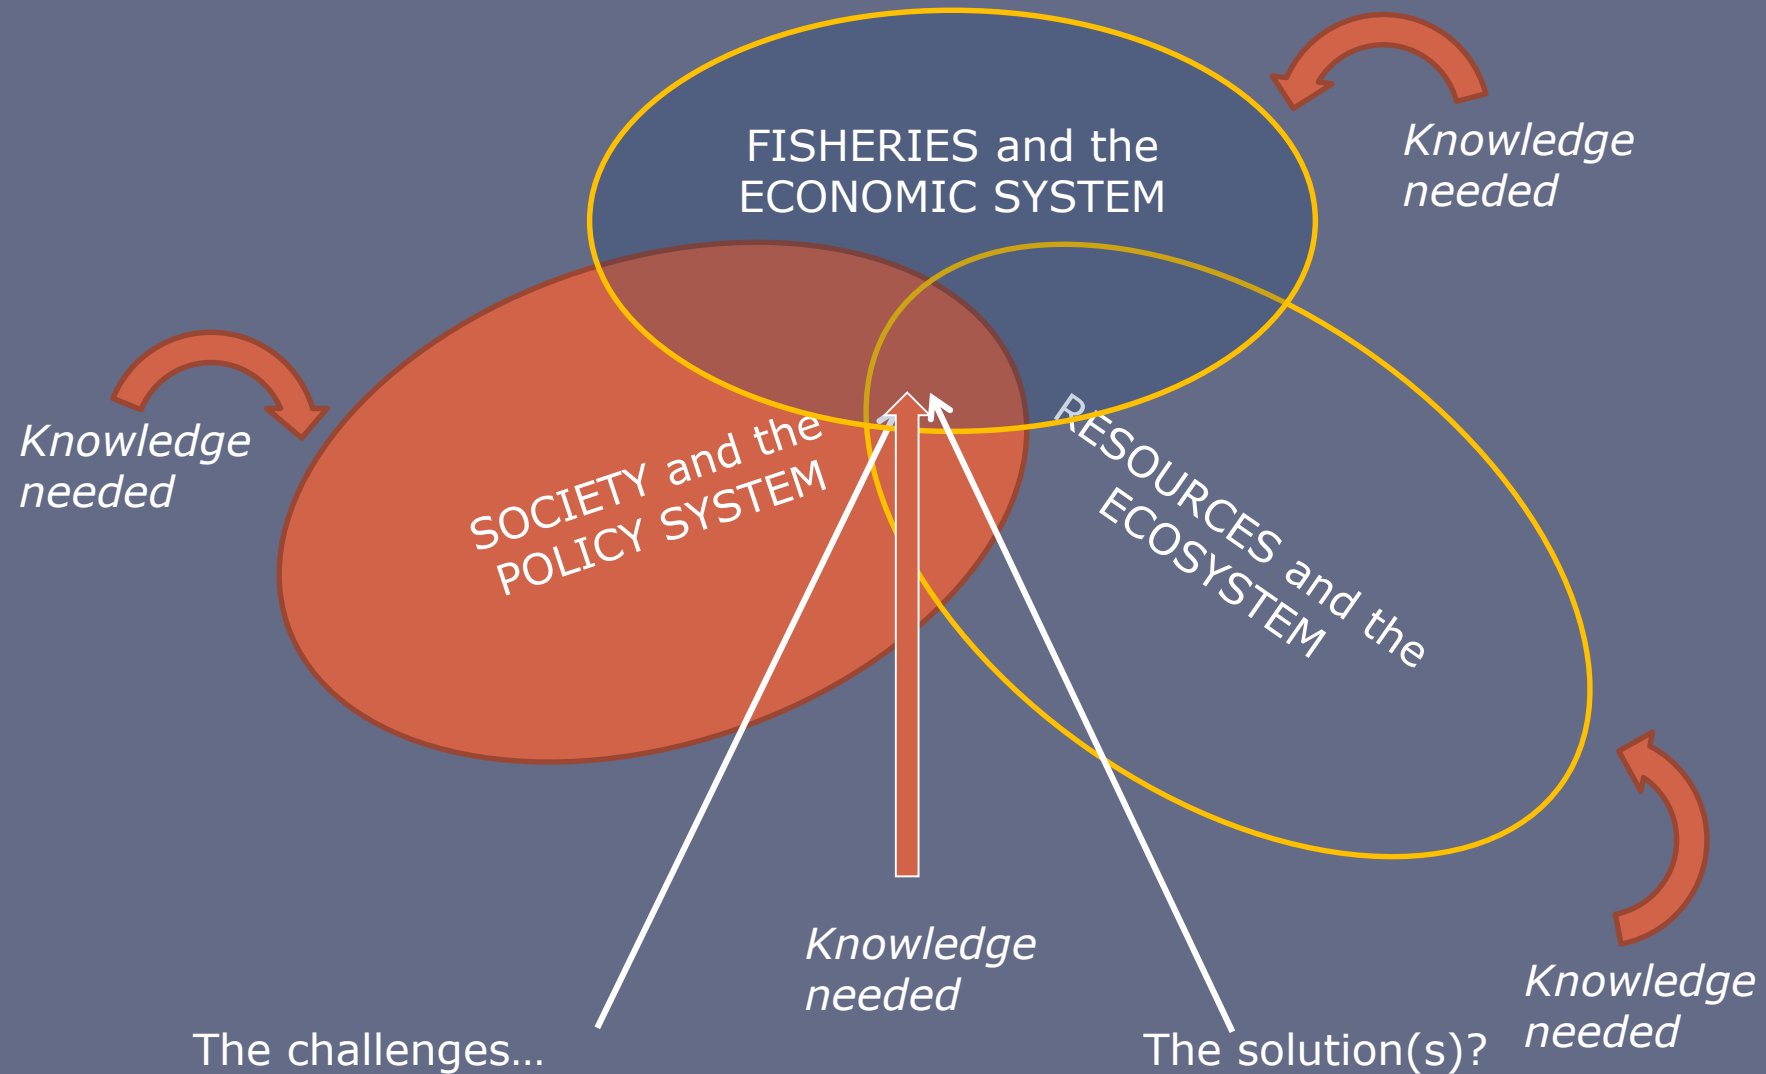

- Work closely with all groups of stakeholders
- Bring facts on what is known and what is not known, and work up to fill the gaps
- Share knowledge across regions and disciplines
- Merge various sources of information into a whole-scale picture
- Contrast local against global realities
- Link biological processes with socio-economic constraints
- Propose alternative cost-effective technological strategies
- Conduct trials and assess bottom-up initiatives
- Communicate trade-offs and orientate rational policy
- Enhance control and monitoring
- Tell the good story

# I. DISCARDS... WHAT IS THE PROBLEM?

# Discards – when three systems conflict

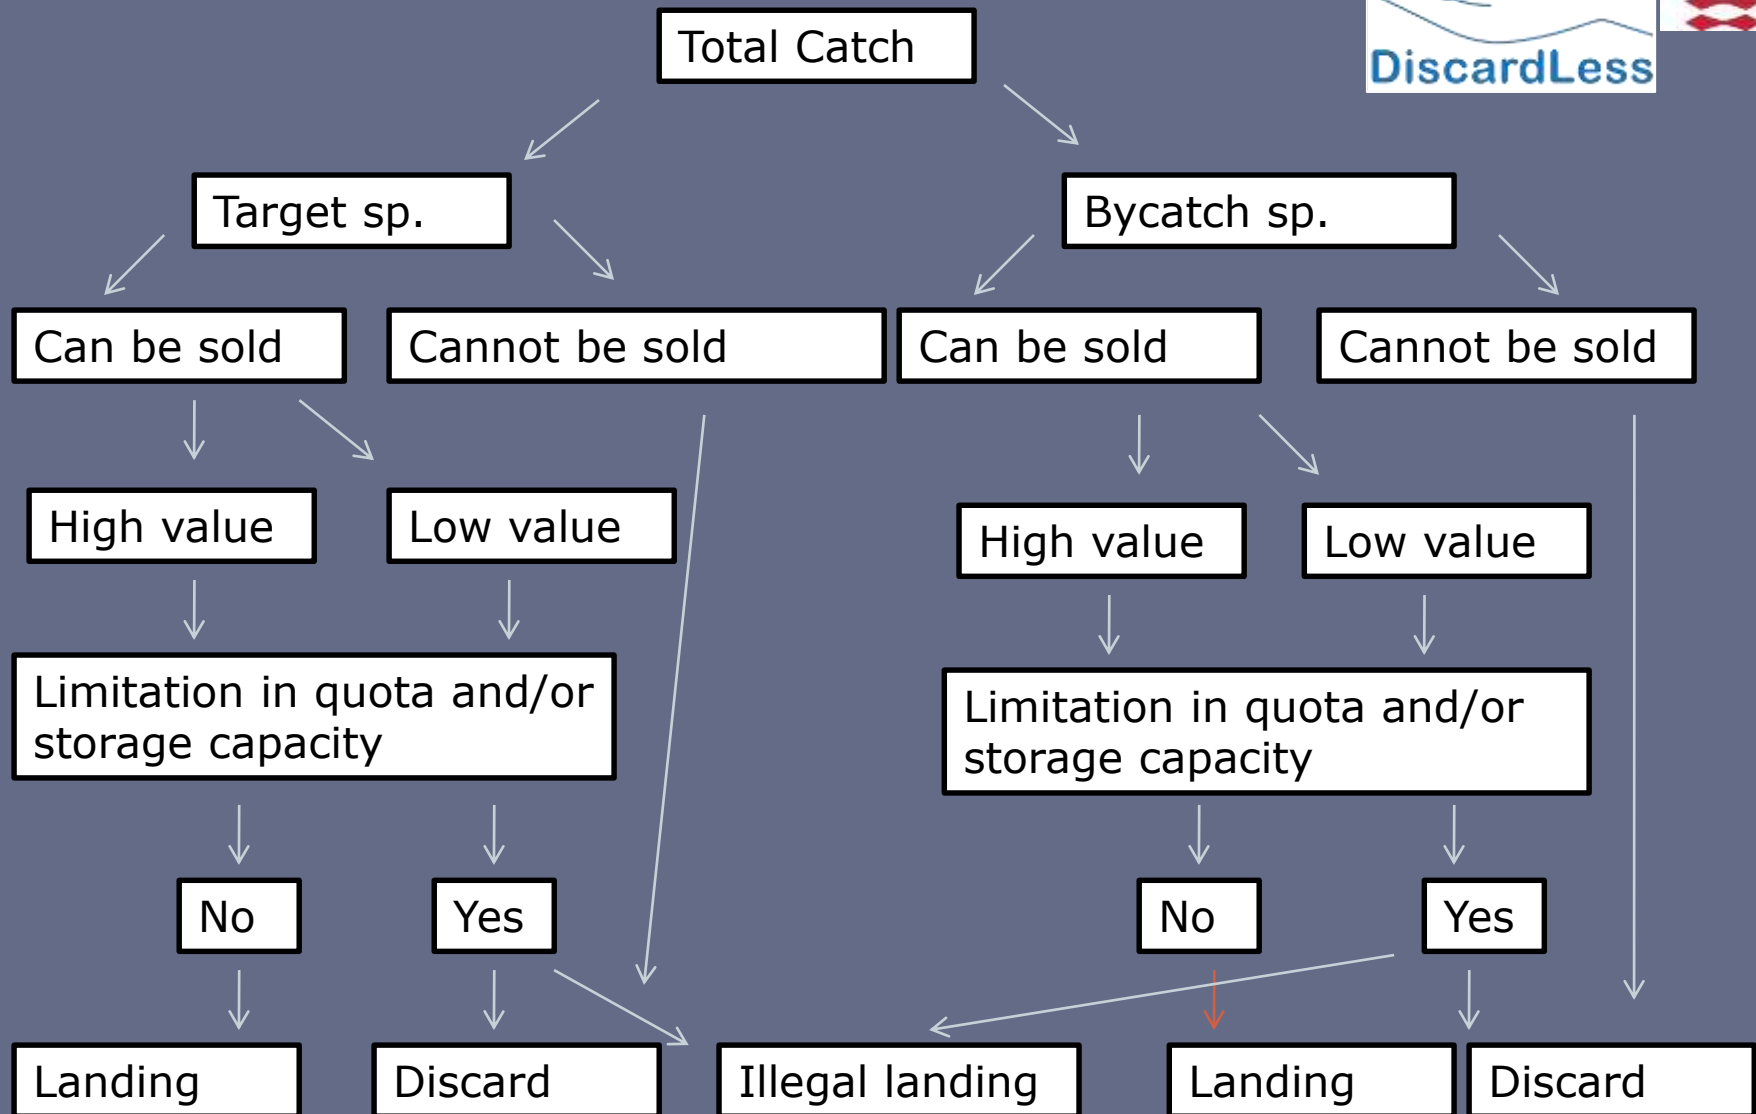

# I.1 – Why do discards exist?

- Regulation (size)
- Low quota
- Damaged fish
- Low value
- High-grading

Mixed-fisheries issues

Catchpole et al., (2013)

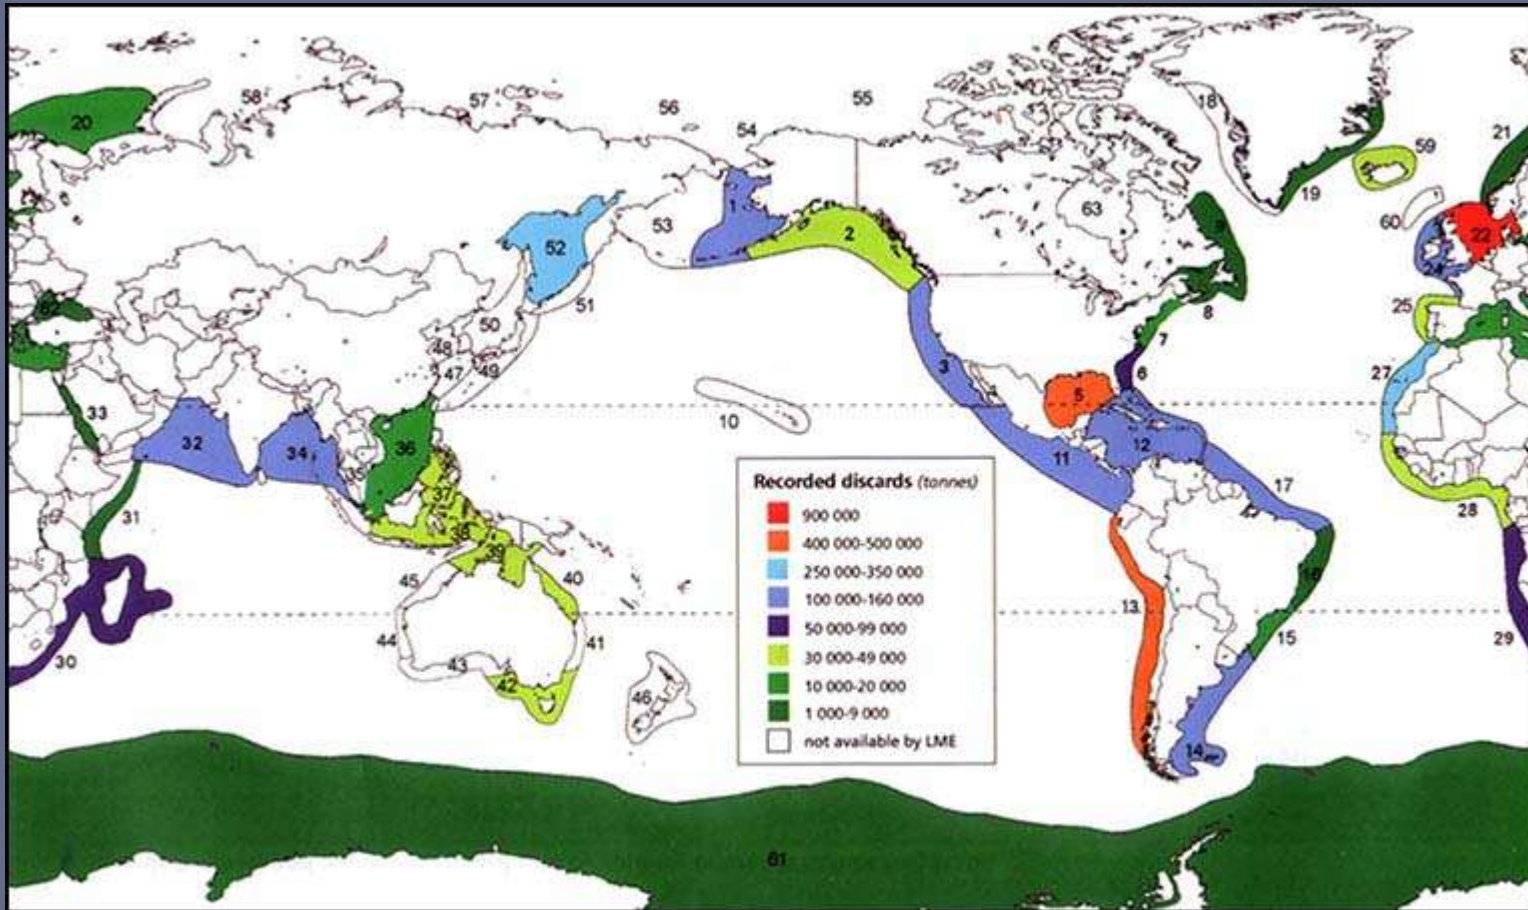

## I.2 Discards exist because it is more cost-efficient than retaining onboard

### Legal discarding means:

- Higher landings value
  - Selection of species
  - Selection of sizes
  - Cleaner landings
- Lower costs
  - Fewer trips
  - Less sorting time
  - Less crew
  - Less infrastructures at shore
- No choke effect
- Less control and monitoring

# Low discards are not necessarily linked with good management... and vice-versa

(FAO,  
2005)

# Understanding the “North Sea madness”: North Sea cod vs. North Sea plaice

- North Sea cod:
  - 80% decrease of TAC in 4 years
  - Days at sea regulation
  - Increased high-grading
  - Situation worsened by biomass started to increase
  - → TAC did not constrain fishing mortality

# Understanding the “North Sea madness”:

## North Sea cod vs. North Sea plaice

- North Sea plaice:
  - Enormous quantities of discards in the sole beam trawl fishery
  - Mainly size-related
  - Low value of plaice
  - Discards well correlated to both recruitment size and TAC

## summary: Are discards an issue for sustainability?

- It depends on the quantity of discards and the sensitiveness of the stock
- Uncertain discards affect the estimation of recruitment
- Regulatory discards vs. Technical discards
- The number of commercial stocks with discards estimates included in the assessment and advice has been regularly increasing.

## II. DATA ISSUES

## II.1 – Statistical Sound Sampling

- Choose a random trip – from a draw list
- Ask to get on the first conducted trip
- Register the fisherman answer
- Conduct a discard trip
- Raise the trips conducted to the total fleet
- Quality control

# Fishers answer

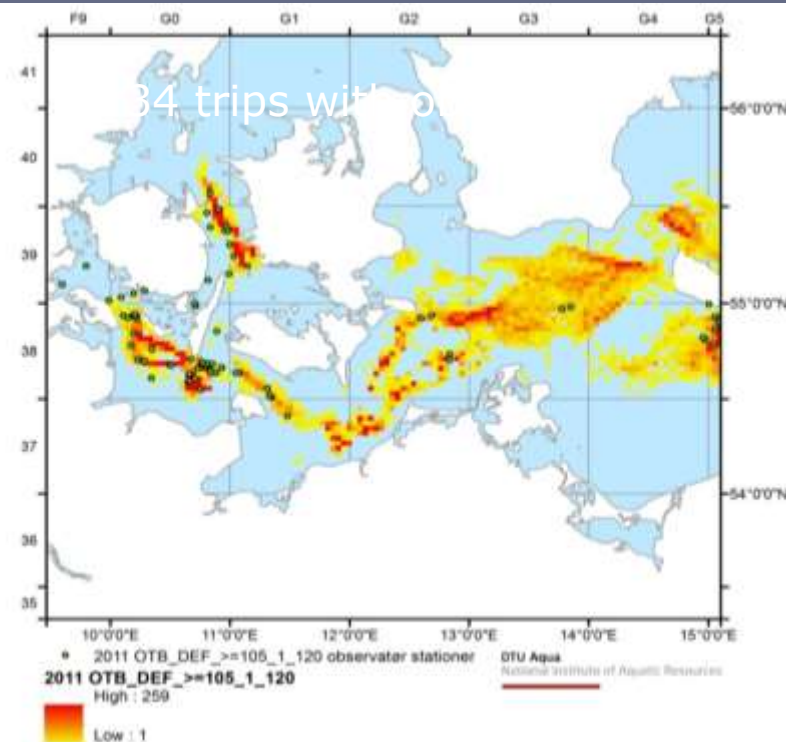

OTB - Kattegat

## OMR 21 - OTB

Fisker svar	1. kvartal	2. kvartal	3. kvartal	4. kvartal
fisker ikke lige i øjeblikket				
FORLIS		1	1	
Fisker i andet område	15	31	4	
ingen kontakt	10	7	1	1
ja	2	10	21	7
prøv senere	17	7	4	
siger hans båd er for lille	18	15	7	
solgt	7	11	8	2
Vil ikke have os med	30	32	11	3
Total	99	114	57	13

# Quality control – comparison with or without observers

## Western Baltic

## II.2 But when discarding becomes illegal...

- Fishermen must write discards in their logbooks
- Can we trust information?
- Do they still accept observers onboard?
- Do they change behaviour when an observer is onboard?

# First experiences after one year of landing obligation

- Denmark – Baltic cod < MCRS

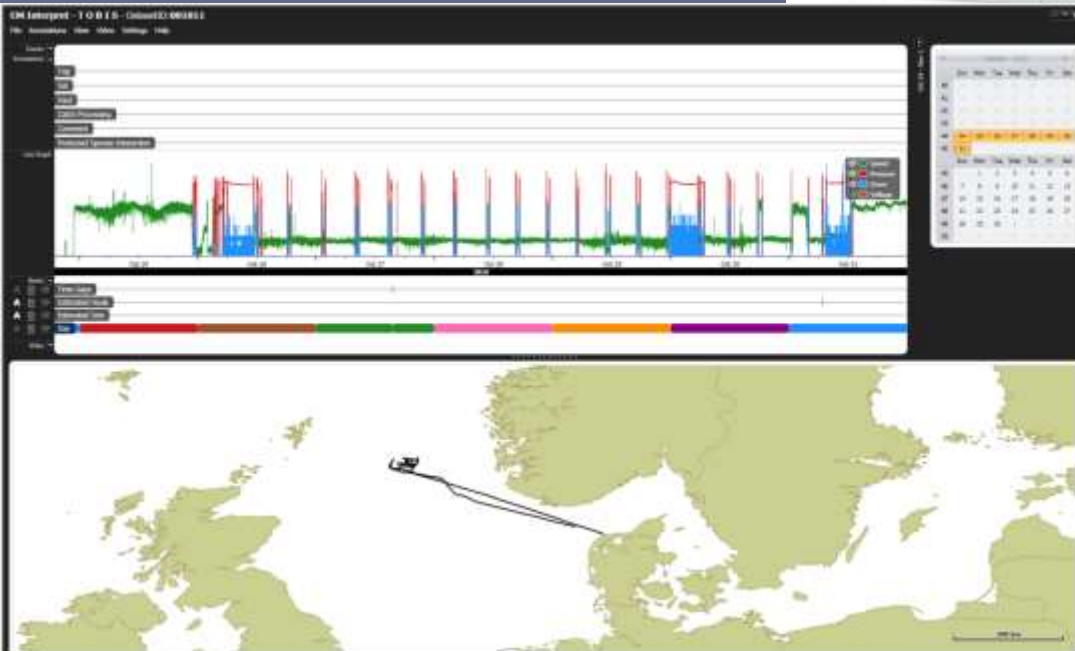

- Other countries : The refusal rate has increased dramatically and many skippers state that " they never want to see an observer again"

## II.3 Remote Electronic Monitoring and Fully Documented Fisheries

Copyright 2011 Archipelago Marine Research Ltd.

Ulrich et al., 2015

<https://www.youtube.com/watch?v=6ZNv09wiYk>

AnchorLab system

# REM... Hated but obviously useful!

- Various trials ongoing in several North Sea countries
- Including catch quota management with increased cod quota
- More cost-efficient than any other control tool
- Deterrent and awareness effect
- Major technological progresses ongoing

French et al., 2015

Correlation between fishers' self estimate and video inspection,  
MINIDISC trial (Mortensen et al., 2016)

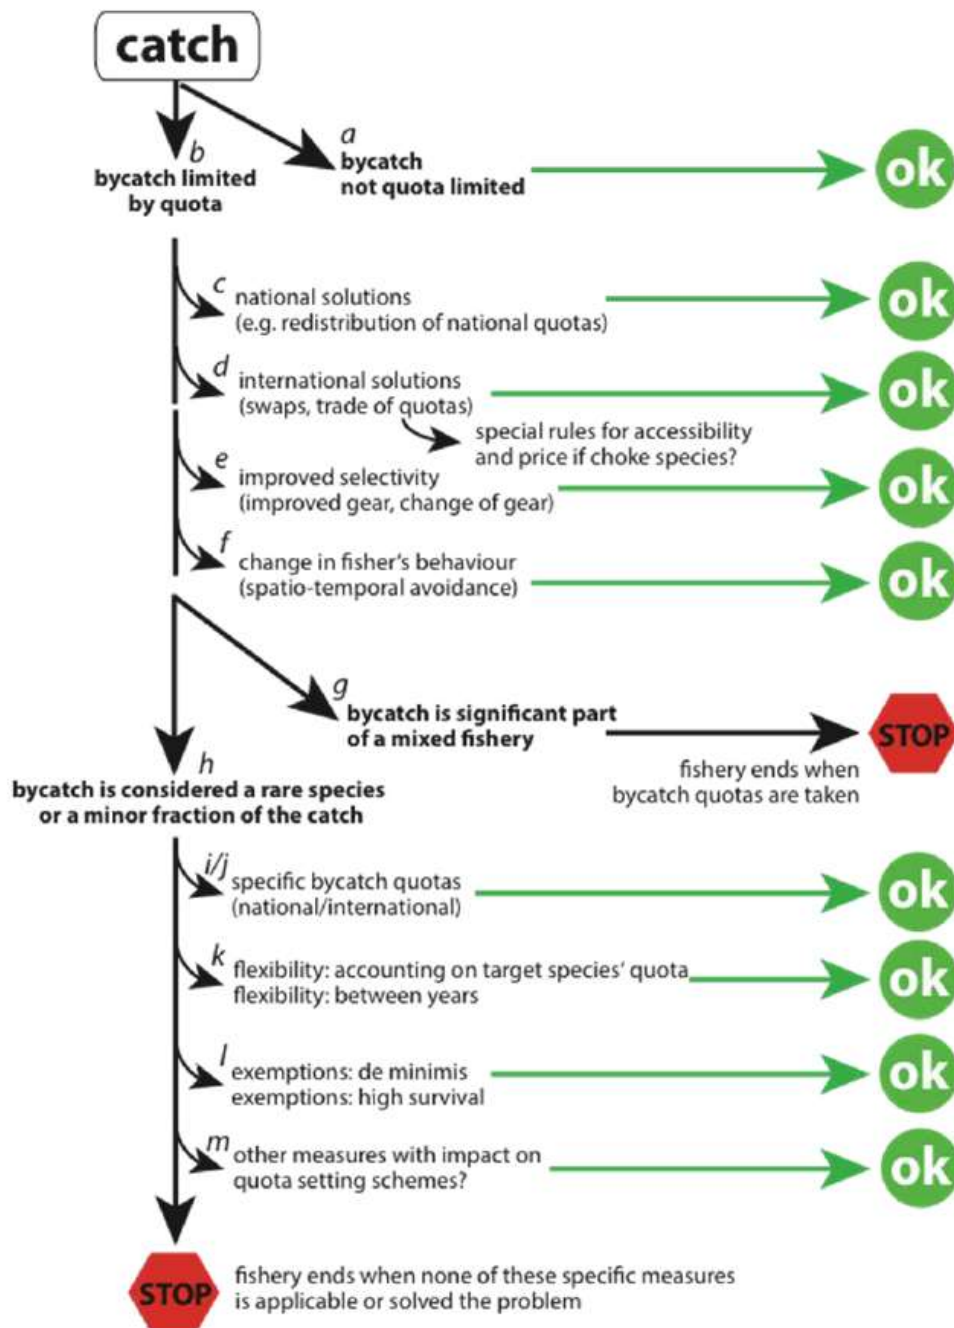

# Summary

- The monitoring of discards has greatly improved over the last ten years, owing to EU framework for data collection
- This has improved the quality and reliability of stock assessment and advice
- Voluntary scheme that requires collaboration and acceptance from the fishing industry
- It is greatly feared that the quality of catch data will deteriorate with the landing obligation
- CCTV can be used as a supplementary tool but there is great reluctance in many places

# III. AVOIDING DISCARDS AND BYCATCH

Decision tree for reducing choke effects

Zimmermann et al., 2016

# III.1 Escapement and selective gears is this the magic solution?

- Research on fish behaviour to increase selective avoidance
  - <https://vimeo.com/channels/801304>
- Tailoring specific solutions to specific problems
- Which of the trawl elements influence most the catching processes?

# Fish behaviour for improved selectivity

>60 sheets, Catalogue released in Feb. 2017

Factors influencing fish vertical distribution

*B. O' Neill, MSS*

## using a flexible grid to reduce capture of haddock, whiting and haddock in a nephrops trawl

### TARGET SPECIES

Nephrops and mixed round and flatfish

### AREA, VESSEL

25 catch comparison hauls took place in the North Sea on board the FV Amity II PD 177 (21m, 400kW) during November 2012.

### GEAR MODIFICATION

A flexible grid with 45mm bar spacing and with bottom gaps of (i) 315mm and (ii) 200mm was fitted into the extension of a nephrops trawl

Average % reduction		
grid	315 mm	200 mm
Cod	66	95
Haddock	55	78
Whiting	73	81
Monkfish	76	84
Saithe	87	98
Plaice	78	74
Lemon sole	23	24
Nephrops	-3	-1

### RESULTS

- there were no losses of haddock or whiting
- fewer smaller cod (< 78 cm) were caught, but above 78 cm, there was no difference
- monkfish catches were 18% less, but these were all small (< 55cm)
- megrim catches were reduced by 43%

### FURTHER INFORMATION

## III.2 – Avoidance through changes in time and space

- Tentative prediction of "hot-spots"
- Real-Time closures

*(Holmes et al., 2011)*

Vermard 2016

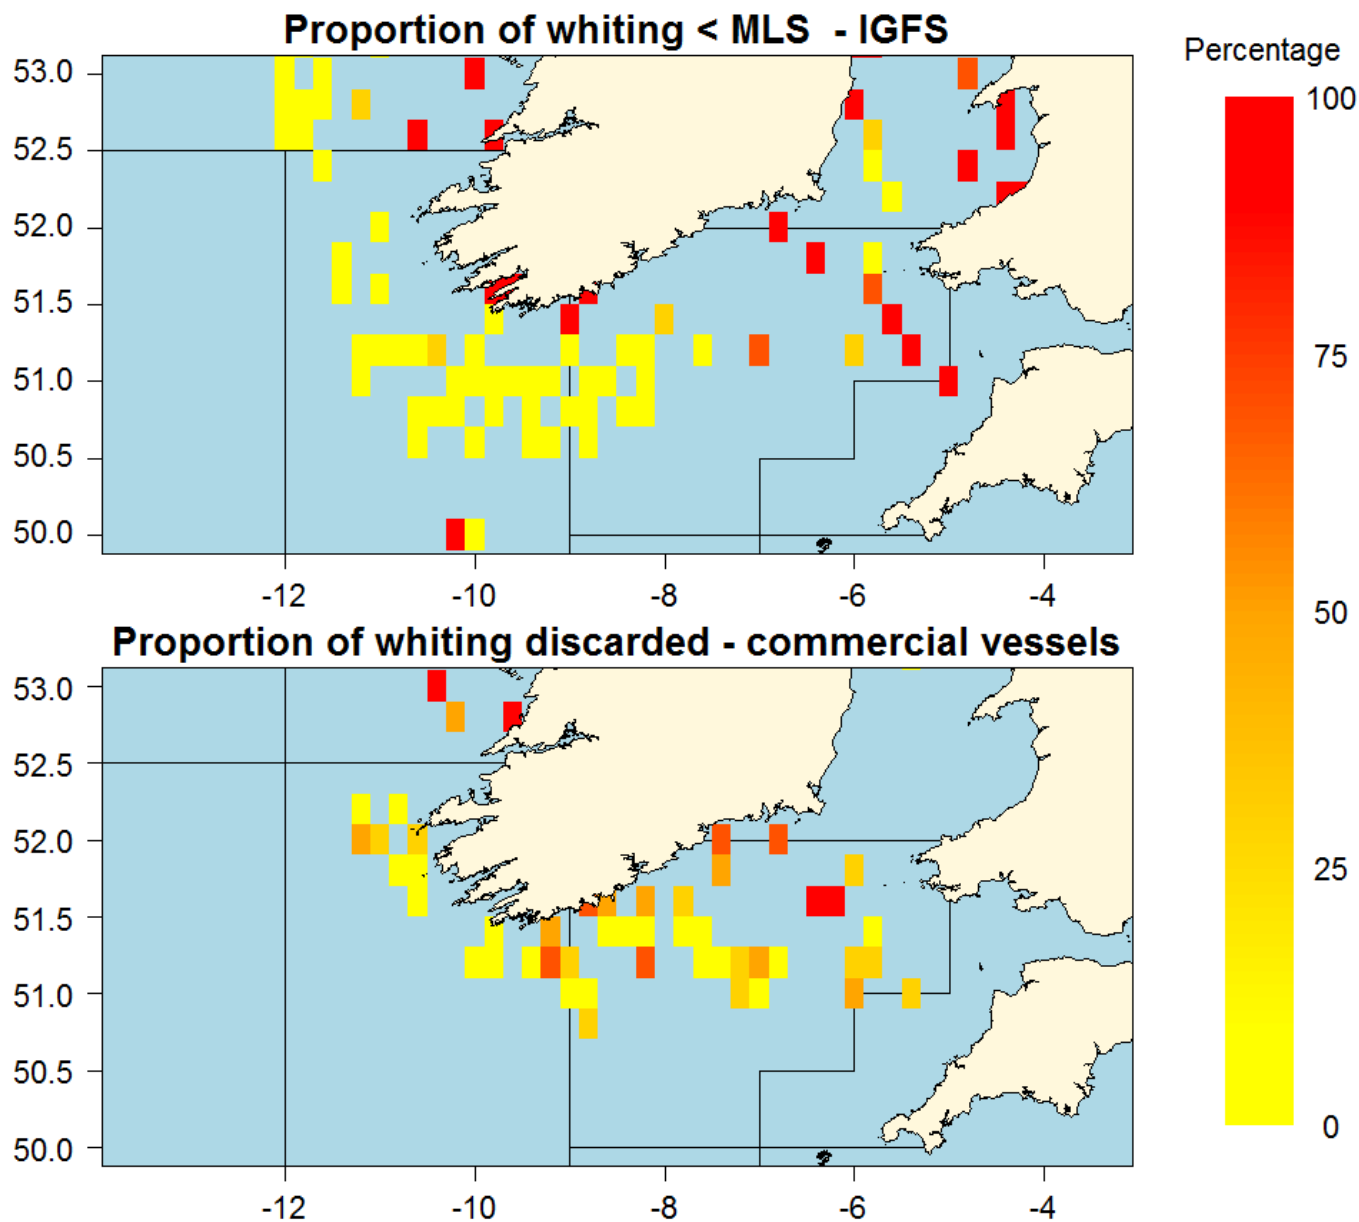

# But that is not so easy!

Spatio [Letters]-temporal  
[colour] correlations  
between sole and plaice  
in the North Sea,  
Rijnsdorp et al., 2006

# Survey data as a predictive tool?

*It is likely easier to predict where bycatch risk is low than where bycatch risk is high!*

## III.3 The difficulty to incentivise changing behaviour

- Lack of proper incentives and motivation
  - Economic (loss of commercial catches)
  - Regulatory (Difficulty to have new gears agreed)
  - Peer pressure (nobody or everybody)
- Exponential increase in technical regulations and micro-management
- The selective gear is modified afterwards
- How to improve uptake and use of selective behaviour?
  - Coercive ;-(
  - Voluntary

# Exploring individual ideas for reducing discards without reducing profits

*Mortensen et al., 2017*

Area	Vessel	Hauls	Landings	Discards	Ratio	Hauls	Landings	Discards	Ratio	Change

		30	2024	665*	24.7*	37	2238	474*	17.5*	- 7.2*

# Incentives

- Types of incentives
  - Access to closed areas,
  - Additional quotas,
  - Revenue guarantees,
  - Covering the cost of gear modifications,
  - Prize money
- The right incentive for the right case
  - Case specific
  - Promote fishermen's ideas without it resulting in financial difficulties for them
  - Does not lead to artificial involvement
  - Encourages involvement and delivers strong results
- But – No perfect solution exist, trade-offs might be required

# Results-Based Management

- The industry is accountable of its full impact
- Regardless of how it is produced
- The impact must then be fully documented
- Some fishermen are already moving forward
- FDF trials / Eco-Labeling
- [https://www.youtube.com/watch?v=bpH\\_dtM5suU](https://www.youtube.com/watch?v=bpH_dtM5suU)
- <https://www.youtube.com/watch?v=zsuNxpH4alo>

# IV. MAKING USE OF DISCARDS ("KEEPCARDS")

# Fish waste bears a great potential

# Experience from Iceland

After 30 years of a discard ban

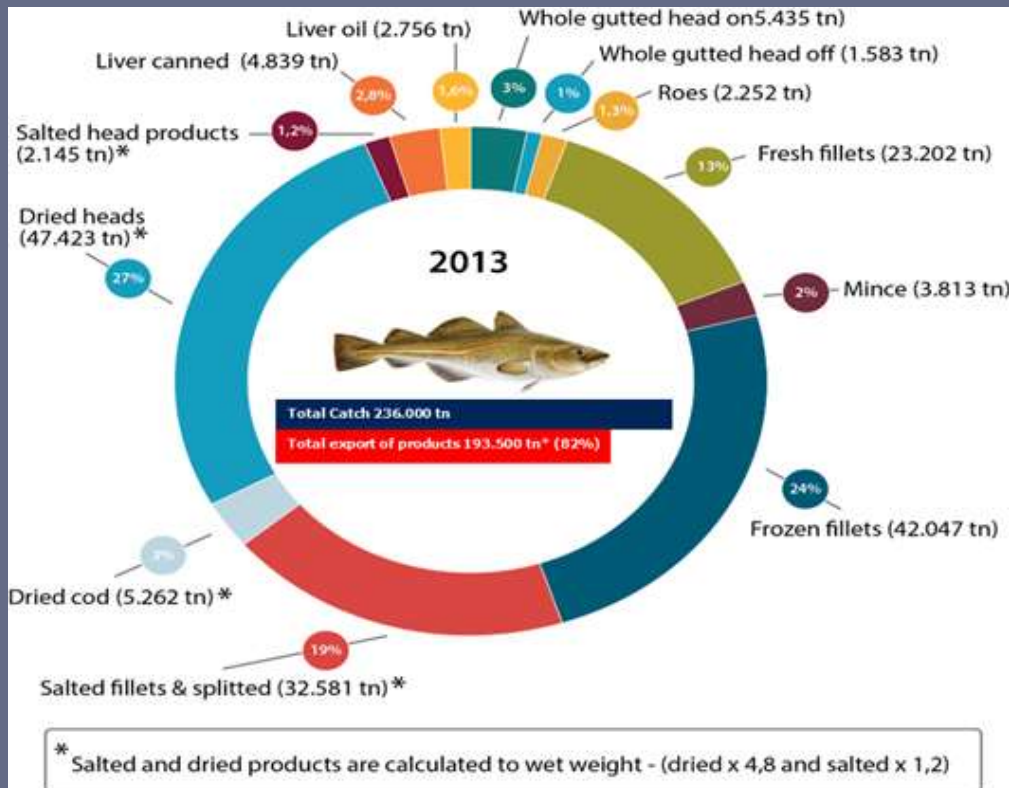

Figure 11: Fashion clothing and accessories made from fish skin

Vidarsson et al., 2015

# Main issues

- Storage onboard (space/ice/handling type)
    - Difficult on small and old vessels
  - Contamination of fresh products
  - Heterogeneous sizes and quality
  - Handling in harbours (lack of infrastructure in small harbours)
  - No long-term market if discards are avoided
  - Constraining regulation
- 
- → Who shall pay?

# Onboard handling of unwanted catches

*J. R. Viðarsson, MATIS*

Coastal Vessel 11m

Bottom trawler 23 m

Bottom trawler 39 m

Large trawler 50 m

- Many options already exist... mainly for larger trawlers
- Investment Payback time estimated 1-2 years

# Summary of DiscardLess results so far

- Addressing choke species requires
  - Analysing issues at EU, regional, national, fishery and individual levels
  - Making knowledge on existing options easily available and shared
  - Exploring new ideas, including technical feasibility, cost-benefits and controllability
- Everything is easier when stocks are not depleted ( $>B_{pa}$ ) and exploited around  $F_{msy}$
- The discard ban has transformed the fishery sector in Iceland, Norway, Feroese islands... but it took several decades
